COSC 1P03
Assignment 1 Script

To prepare for submission, run your program using the Test.dat file as the question bank. The tests will each have 5 of the 7 questions in the bank. Run the test for 3 students and answer the questions so that some questions are right and some are wrong so not all students get the same mark. Your output (report) will not be identical to the sample unless you arrange to answer the correct number of questions correctly for the three students.

Note that there are a couple of bugs (features?) in the `BasicIO` library. In particular, when `RadioButtons` are cleared (either via `clear` or `clearAll`), the last button selected will remain selected (i.e. no apparent effect). Similarly, when a `TextArea` is cleared (either via `clear` or `clearAll`), the first line of the text area has a single space so writing to the text area will start at the second character position on the first line. There is no need to try for a workaround for these bugs in your program.
